

Diabetes and Your Weight

Did you know that about 8 out of 10 people with type 2 diabetes are obese (ie, they are at least 20% heavier than their ideal body weight) or have a history of being obese when they are diagnosed with diabetes? Fortunately, with your health care provider's help, you can take simple measures to understand your risk of excess weight and begin to do something about it.

Consider These Facts

- Since the early 1960s, the prevalence of obesity among adults more than doubled, increasing from 13.4% to 35.7% in US adults age 20 and older.
- Patients who carry excess fat around their waists (waist circumference ≥ 35 " in women or ≥ 40 " in men) are more likely to have health problems than if their fat is in their hips and thighs.
- Excess mid-waist fat is associated with type 2 diabetes due to insulin resistance.

Extra weight can put people at higher risk for many health problems, including:

- **Type 2 diabetes**
- **High blood pressure**
- **Heart disease and stroke**

Take These Simple Steps

Two simple measures can give you and your health care provider good estimates of any excess body weight you may have:

- 1. Measure your waist**—Use a tape measure around your bare abdomen just above your hip bone (relax and breathe out when you do this). Talk with your health care provider if your waist measures over 35 inches (women) or 40 inches (men).
- 2. Body Mass Index (BMI)**—BMI relates how tall you are to how much you weigh and is generally a good measure of body fat. Use the BMI chart on the next page to find your height and weight and determine the weight group in which you belong. The chart applies to all adults. Speak with your health care provider if your BMI is in the overweight, obese, or extreme obesity range.

Ask Your Health Care Provider About Reaching a Healthy Weight

If you and your health care provider find that being overweight is a risk factor for you, a few steps can go a long way to help.

Shift your diet away from saturated fats and trans fats and toward unsaturated fats. Lighten up on your sugar and salt. Eat more fruits and vegetables, whole grains, and nuts—they're natural, good for you, and delicious!

And aim for at least 30 minutes of physical activity most days of the week; if needed, your health care provider can recommend physical therapists, nutritionists, and other health care professionals who can help you meet your goals.

You are not alone if body weight and diabetes are a concern. With your health care provider's help, you can make progress towards a healthy weight and managing diabetes. It's easier than you may think!
